

Your AI team. Real work. From anywhere.

Direct complex tasks from your phone.
Let your AI team work on the machines you connect.

Multi-VP teams / Your system prompts / Work Center automation

WHY YEAFT

Delegate the work—not another round of prompting.

Imagine asking from your phone: “Fix this bug, add a regression test, and prepare a reviewed patch.”

ACCESS

Away from your desk.

The code and tools are on another machine. You still need to move the task forward.

COORDINATION

More than one role.

Investigation, implementation, and review need distinct responsibilities.

FOLLOW-THROUGH

Beyond one reply.

Complex work needs execution, checks, recovery, and a clear completion condition.

Yeaf brings access, team control, and task execution into one product.

CROSS-DEVICE EXECUTION

Your phone is the control surface. The Agent does the work.

Use a mobile or desktop browser. Connect the machine that has your project and tools.

Files, shell, and provider access stay Agent-side.
Requires a reachable Server and an online Agent.

Step away from the desk—not from the task.

START FROM YOUR PHONE

The project stays on the Agent.
The conversation comes with you.

Send the goal. Read named replies.
Add direction when the work needs a decision.

Continue in a desktop browser with the same Agent + Session.

One workspace. Different minds on the problem.

BUILD

Give an implementer a focused responsibility.

CHALLENGE

Let a reviewer question the result—not just echo it.

03 / YOUR SYSTEM PROMPTS

Define how your AI team works.

Configure VP personas. Carry shared rules through Project instructions and repository docs.

VP PERSONA / EXAMPLE

Give the role a contract.

“Act as an implementer.
Make the smallest useful change.
Report tests and open risks.”

PROJECT RULES / EXAMPLE

Keep standards consistent.

“Review the exact revision.
Ask before deployment.
Never claim an unrun test passed.”

Reusable instructions—not a one-off reminder in every conversation.

Give it a goal—not a script of prompts.

Use Session to work with AI. Use Work Center to delegate work to AI.

Less turn-by-turn supervision. A persistent goal with visible execution.

More than a chat window: a working environment.

FILES / inspect the actual source

```
146 // — 1. Determine config + store
147 //      Must happen BEFORE loadC
148 //      default config.json that
149 //      (metadata/roster/config/
150 //      and stays under configDi
151 //      tier for assets such as
152 const overrides = { ...configOvrr
153 if (dir) overrides.dir = dir;
154 if (model) overrides.model = model
155 if (language) overrides.language =
156 if (debug !== undefined) overrides
157
158 const sessionWorkDir = typeof work
159 const configDir = overrides.dir ||
160 const yeaftDir = configDir;
161 const configInitResult = initYeaft
162 const storeInitResult = configInit
163 overrides.dir = configDir;
164
165 const managedCliInstall = managedC
166
```

Stay close to the files the Agent works with.

TERMINAL / inspect command output

```
STAGED INSPECTION DEMO · read-only
Real command result; replayed via demo transport.
Source commit: a282ddb4cc5
Node v24.15.0

$ node --check agent/yeaft/session.js
[capture runner] exit code: 0

Scope: JavaScript syntax only. No regression suite or release claimed.

$
```

Example: `node --check`, not a full test suite.

The task persists beyond the conversation.

KEEP THE GOAL

WorkItem: objective and acceptance criteria

FOLLOW THE WORK

Action: assigned work and current status

INSPECT THE RESULT

Run: execution attempts and evidence

Let AI keep working. Keep the decisions that matter.

AUTOMATE

Beyond chat turns.

Ready work runs on the Agent. Outcomes and bounded retries do not need a fresh prompt each time.

INTERVENE

Keep key decisions.

Review progress. Supply missing input. Resolve blockers or stop the work.

ACCEPT

Against the goal.

Completion depends on acceptance checks—not merely an assistant saying “done”.

Within configured tools and permissions. Instructions are not a sandbox.

WHY THIS COMBINATION MATTERS

An AI workspace built around getting work done.

Access, team design, behavior control, and automation belong together.

CROSS-DEVICE

Direct real Agent-side work from a phone or desktop.

MULTI-VP

Split responsibilities while keeping contributions visible.

SYSTEM PROMPTS

Shape reusable roles and shared working rules.

WORK CENTER

Delegate persistent goals, not just individual replies.

A phone-sized entry point. A task-sized ambition.

Your next task does not have to wait for your desk.

01

Connect your machine.

Run an Agent where your project and tools already live.

02

Shape your AI team.

Choose VPs. Define their roles and your project rules.

03

Delegate a real goal.

Start from your phone. Give Work Center a bounded task and clear acceptance criteria.
